

Syncscore Badge-Based Onboarding System

Overview

Syncscore implements a progressive, badge-based onboarding system designed to balance low-friction entry with increasing levels of trust validation. The system separates identity verification, professional presence validation, structured capability declaration, and execution verification into distinct layers.

Badge 1 – Identity Verified

Purpose: Eliminate fake accounts. Requirements: - Email OTP verification - OAuth login (Google / LinkedIn) - Entity selection (Individual / Company) Outcome: - Account activated - Not publicly searchable yet

Badge 2 – Professional Presence Verified

Purpose: Eliminate fake professionals and establish public accountability. Mandatory: - LinkedIn profile - GitHub profile - At least one Proof Artifact Accepted Proof Artifact Types: - Open-source GitHub repository - Live demo link - Public product page - Technical blog with architecture explanation - Sandbox deployment - Public case study Syncscore performs lightweight checks such as: - Public accessibility - Recency validation - GitHub activity signals (if applicable) - Coherence between identity and proof artifact

Badge 3 – Capability Declaration & Syncscore Generated Capability Document

Purpose: Structured capability identity backed by evidence. Producer completes a structured Capability Declaration covering: - RAG capability - Agent systems - Tool orchestration - Memory systems - Deployment type - Framework familiarity Syncscore then: - Cross-checks declaration with proof artifacts and metadata - Generates a structured Capability Document - Assigns Verified vs Declared flags - Computes a Confidence Score - Assigns a Tier classification Editable Sections: - Narrative description - Positioning summary - Focus industries System-Controlled Sections: - Verified capability flags - Confidence score - Tier badge - Execution verification status

Badge 4 – Execution Verified (Optional Advanced Tier)

Purpose: Higher credibility and differentiation. Requirements: - Completion of standardized Syncscore capability challenge OR - Structured behavioral validation Outcome: - Execution Verified

badge - Higher ranking priority - Advanced trust status

Strategic Benefits

- Progressive trust layering - Execution-first philosophy - No source code storage required -
Cost-effective verification model - Fraud-resistant structure - Transparent declared vs verified
capability separation
